Critical Hit

[176](#) [EDIT](#)

Critical hits, also known as **crits** for short, are otherwise normal [weapon](#) strikes that randomly deal increased [damage](#) on enemies. The likelihood that an attack will be a critical hit is based on the weapon's **critical hit chance**, and the additional damage dealt by a critical hit is determined by the weapon's **critical damage multiplier**. Each attack, or each pellet in the case of most shotguns and weapons with [Multishot](#), rolls its own chance to critically hit.

When a weapon deals a critical hit, the damage is displayed as a yellow, orange or red number on the [HUD](#) instead of the usual white coloring. However, critical hits on [shields](#) are still blue, and attacks benefitting from the [stealth damage bonus](#) are always yellow even when they don't crit.

Critical Chance

[Contents](#)[WARFRAME Wiki](#)

Chance that any given attack will do bonus Critical Hit Damage. Values over 100% have a chance to become Big Critical Hits (orange), and over 200% have a chance to become Super Critical Hits (red).

—In-game Description

Each weapon has a base chance to critically hit, which can be increased through [mods](#) and various [buffs](#).

- 1.1. Relative Increases
- 1.2. Absolute Increases

Relative Increases

Most increases to crit chance are relative **to the base chance**. Multiple of these stack additively with each other:

$$\text{Total Crit Chance} = \text{Base Crit Chance} \times (1 + \text{Relative Bonus})$$

Where the **Relative Bonus** is the sum of all applicable bonuses.

$$\text{Relative Bonus} = \text{Bonus}_1 + \text{Bonus}_2 + \text{Bonus}_3 + \dots$$

As an example, a  [Braton](#) with  [Point Strike](#) and  [Argon Scope](#) has a crit chance of:

$$12\% \times (1 + 150\% + 135\%) = 46.2\%$$

Absolute Increases

A few effects grant absolute amounts of crit chance which are applied after relative bonuses.

-  [Puncture's status effect "Weakened"](#)
-  [Arcane Avenger](#)
-  [Cat's Eye](#)
-  [Ballistic Bullseye](#)
-  [Shadow Haze](#)

$$\text{Total Crit Chance} = \text{Base Crit Chance} \times (1 + \text{Relative Bonus}) + \text{Absolute Bonus}$$

Where the **Absolute Bonus** is the sum of all applicable bonuses.

$$\text{Absolute Bonus} = \text{Bonus}_1 + \text{Bonus}_2 + \text{Bonus}_3 + \dots$$

As an example, a Braton with  [Point Strike](#) (*relative*) and  [Arcane Avenger](#) (*absolute*) has a crit chance of:

$$12\% \times (1 + \text{150\%}) + \text{45\%} = 75\%$$

Blood Rush

 [Blood Rush](#) and the [Gladiator Set Bonus](#) are unique in that they scale off of Melee [Combo](#), stacking additively with other critical chance mods:

$$\text{Total Crit Chance} = \text{Base Crit Chance}$$

$$\times (1 + \text{Relative Bonus} + \text{Blood Rush Multi} \times (\text{Combo M} \\ + \text{Absolute Bonus}))$$

As an example, a  [Gram](#) with maxed  [True Steel](#) and  [Blood Rush](#), with a x7 combo multiplier :

$$15\% \times [1 + \text{120\%} + \text{40\%} \times (7 - 1)] = 69\%$$

Critical hit chance can surpass 100%, for further information read [Crit Tiers](#).

Critical Damage (Critical Multiplier)

Critical Hit Damage is multiplied by this value.

The added Damage is doubled for Big Critical Hits (orange), and tripled for Super Critical Hits (red).

—In-game Description

When a critical hit occurs, that hit's **damage is increased** and the damage value's color is changed to yellow. The stat describing by how much a crit is strengthened is

Modded Crit Multi = Base Crit Multi × (1 + Bonus₁ + Bonus₂ + Bonus₃ + ⋯)

The base critical multiplier of a weapon is quantized.^{[1][2]} This applies before mods, but after certain effects that are additive to the base value. The quantized base critical multiplier can be calculated as:

$$\text{Quantized Base CM} = \text{Round}\left(\frac{\text{Base CM}}{32/4095}\right) \times \frac{32}{4095}$$

As an example, a [Braton](#) with [Vital Sense](#) excluding quantization for simplicity, has a crit multiplier of:

$$\text{.....} \times (1 + \text{.....} 120\%) = 3.52x$$

Another similar example, now including quantization, and now with the incarnon perk Critical Parallel yields a crit multiplier of:

$$\text{Round}\left(\frac{1.6 + 0.4}{32/4095}\right) \times \frac{32}{4095} \times (1 + 1.2) = 4.401074481x$$

Sources of Critical Damage Bonus

[Rifle](#) [Shotgun](#) [Pistol](#) [Melee](#) [Archgun](#) [Archmelee](#) [Companions](#) >

[Vital Sense](#)[Hammer Shot](#)[Bladed Rounds](#)

[Mutalist Quanta](#)'s alternative fire; shooting bullets through the Infested orb will boost the weapon's critical multiplier

Crit Tiers

When a weapon achieves a crit chance **higher than 100%**, every attack will crit but it also gains a chance to deal an even stronger crit. As the critical hit chance increases, the tier of critical damage does so as well.

Although the coloration remains red after a certain point, crit tiers continue to increase. Every tier above 3 will produce an additional exclamation mark (!) up to three times.

As an example, a [Lenz](#) with [Point Strike](#) has a crit chance of:

$$50\% \times (1 + 150\%) = 125\%$$

This means it will have a 25% chance to trigger an orange crit, while all other hits (75%) will yield a yellow crit.

Modded Crit Chance		Crit Tier & Coloration
$x \leq 0\%$	No hit can crit	Tier 0
$0\% < x < 100\%$	Chance for a yellow crit	Tier 1
$x = 100\%$	All hits yellow crit	
$100\% < x < 200\%$	Chance for an orange crit	Tier 2
$x = 200\%$	All hits orange crit	
$200\% < x < 300\%$	Chance for a red crit (tier 3)	Tier 3
$x = 300\%$	All hits red crit (tier 3)	
$300\% < x < 400\%$	Chance for a red ! crit (tier 4)	Tier 4
$x = 400\%$	All hits red crit (tier 4)	
$400\% < x < 500\%$	Chance for a red !! crit (tier 5)	Tier 5
$x = 500\%$	All hits red crit (tier 5)	
$500\% < x < 600\%$	Chance for a red !!! crit (tier 6)	...
...	...	

Three different color tiers of critical hits along with normal damage color

$$\text{Crit Tier Multi} = 1 + \text{Crit Tier} \times (\text{Modded Crit Multi} - 1)$$

As an example, a [Lenz](#) with [Point Strike](#) and [Vital Sense](#) will have an orange crit multiplier of:

$$1 + 2 \times (2.0 \times (1 + 120\%) - 1) = 7.8x$$

In addition, each mod of the [Vigilante Mod Set](#) has a **5%** chance to increase a Primary Weapon's critical hit's tier by 1. This effect stacks with other Vigilante Mods installed, up to a **30%** chance with all six Vigilante Mods equipped.

Critical Headshots

[Certain body parts](#) on enemies, most notably heads, will receive additional damage when struck. This location-based damage increase is usually a 3.0x multiplier, but if the strike is a critical hit, then it receives an additional damage bonus of **2.0x** on top of the location multiplier and the crit multiplier:

This picture displays a headcrit dealing 4x (old : now, it would be 6x) regular headshot damage using an unmodded

[Lex.](#)

$$\text{Headshot Crit Tier Multi} = \text{Headshot Multi} \times (1 + \text{Crit Tier} \times (2 \times \text{Modded Crit}))$$

As an example, a [Lanka](#) with [Vital Sense](#), and a head shot multiplier of 3.0 will have an orange crit multiplier of:

$$3.0 \times (1 + 2 \times (2 \times 2.0 \times (1 + 120\%) - 1)) = 49.8x$$

The Headshot Multiplier is 3.0x in almost all cases. The bonus damage from headshot crits is specific to heads and not generalized to all special body parts. The [MOA](#), for example, has a "[fanny pack](#)" which normally receives 3.0x damage, but does **not** receive any additional multipliers from a critical hit. The [Jordas Golem](#), however, has a 1.0x multiplier on his engines, but still receives increase damage if critically hit. Corpus humanoids do **not** receive headcrits, instead only taking the normal 3.0x headshot damage even after their helmets are removed.

Average Damage

When comparing builds it can be helpful to calculate how much damage the weapon will deal on average, which is affected by how often critical hits occur and at what critical multiplier. The following equation accounts for critical hits that are not headshots:

$$\text{Average Damage Multiplier} = 1 + \text{Total Crit Chance} \times (\text{Total Crit Multi} - 1)$$

$$\text{Average Damage on Hit} = \text{Modded Damage} \times \text{Average Damage Multiplier}$$

$$1 + \underline{30\%} \times (2.0 - 1) = 1.3x$$

Paris with Point Strike and Vital Sense has an average damage multiplier of:

$$1 + (30\% \times (1 + \underline{150\%})) \times (2.0 \times (1 + \underline{120\%}) - 1) = 3.55x$$

So for a Paris without any critical mods, the damage is multiplied by 1.3 on average; yellow crits of 2x for 30% of the shots.

With the 2 basic critical mods, the damage is multiplied by 3.55 on average; yellow crits of 4.4x for 75% of the shots.

Notes

- Most Warframe abilities cannot inflict critical hits. Exceptions include Exalted Weapons, Voruna's Ulfrun's Descent, and Gyre's Passive which grants critical chance per electric proc to all of her abilities.
 - Prior to Update 33.6 (2023-07-27), some abilities had 100% critical chance with a multiplier of 1x. This only served to provide visual feedback.
- As of Hotfix 35.0.9 (2024-01-17), enemies cannot inflict critical hits.

Patch History

Hotfix 35.0.9 (2024-01-17)

- Removed the ability for enemies to deal critical hits to players, Defense targets, Extractors, Rescue targets, and all other friendly targets.
 - In most cases, enemies equipped with “player” weapons (Grineer Ballista using the Vulkan for example) could land critical hits due to those weapons using the same crit setup as their player counterpart. With a lack of feedback to inform players as to why or how sudden damage spikes were occurring, these enemies could easily jeopardize a mission. Additionally, while it makes sense to reward players for landing critical*
