Mover Tuning-Keep media on cache as long as possible

I've got 4tb cache and i would like it to be able to keep as much media on the cache as possible and then only move it when needed (not on a hourly/daily/weekly/monthly schedule).

I ingest about 1tb/month of media so i *should* be able to keep at least 3mo worth of media directly on the cache without having to touch any of the spinning drives.

Currently i have Mover Settings set to Monthly (on the 4th of the month) and Mover Tuning Settings as below, and i noticed that a few days ago my cache drives was basically empty. Is it the first one that i should set to YES? Ideally i would have it so that 90 days would be stored on the cache, and then move media older than 90days (I currently have it set to 75days) off the cache as time goes.

The "Note that setting this to yes effectively disables this plugin" is throwing me off.

Mover Tuning Settings

You can probably set it to 95%, which means when your cache has 3.8TB full, it will move everything over.

Id personally give it more overhead at like 85% full, but I also do big batches of downloads.

Should I still leave the first option to No?

MrChrisse • 5mo ago

Is there an option, if i want to copy all files to the array every night by the Move Scheduler, so they are backed up by parity, but also kept on the cache for fast access and only move (so delete on the array) when the drive is 85% full?

Hylian-Loach • 2y ago

I considered reducing the cache moving to the array, but then I realized all the data in my cache is not protected by parity until it's on the array. I would hate to load a batch of photos onto unraid only to have my cache drive for a few days later and lose the photos

danimal1986 OP • 2y ago

Anything important goes into folders that do no use the cache. That way it goes straight to the array with parity drives.

I realized all the data in my cache is not protected by parity until it's on the array.

While not protected by parity, assuming your ingest pool has redundancy via something like RAID1/10 it's effectively the same thing. If you only use a single cache drive it's definitely a concern though.

Regardless, I fail to see the need to keep downloaded stuff on flash for as long as OP wants it there, though. Must be a niche specific use case.
