Best OS to run docker?

I just installed proxmox on a nuc and I would like to run jellyfin, nodered, home assistant, navidrome, logitech media server and a few other containers. What would be the best way to get these applications running?

If low overhead is desired you could give alpine Linux a try. It's really easy and quick to install.

+1 for alpine linux, very low footprint.

I use Debian 11. Ubuntu's fine too.

Do you run these apps within the os or in docker?

Personally some of those would benefit from being installed outside (without) of docker. I believe everyone forgets that docker ADD yet another layer of abstraction with adds over head.

I do acknowledge that docker makes the implementation of these and others simpler. But at a cost.

Debian or redhat family.

I suggest you to look at CT. Or even for jellyfin there is a LXC to make your life easier.

The best is probably alpine, but if you're already comfortable with a specific distro, it's all Linux, it'll work fine. I like apt so I use Ubuntu LTS.

You can either run docker nested in a LXC or in a VM. The latter is much easier, but uses more resources.

You could also run docker directly on bare-metal Proxmox debian, but that is a bad idea.

I use Ubuntu with a GUI. It is a bad idea in terms of performance, but it allows me to connect remotely for some stuff where I am not comfortable using the command line.

Good old Debian would be a much lighter and better base.
