## Beginner in OpenWRT : Can't set Adguard home as my DNS for all my networks

Hi,

I am new to OpenWRT and managed to have my network configured as well as a guest network. Now I'm trying to put everything behind Adguard Home. I tried to follow this guide : <https://openwrt.org/docs/guide-user/services/dns/adguard-home#installation>

But after doing so I have 2 problems :

1. The guest network no longer have DNS access (so no internet)
2. OpenWRT doesn't have internet access (so it can't download opkg packages for example)

Adguard works only for my main network. Could someone help me to set it up properly ? I can't find how.

Need bind\_hosts (after v0.106.0).

```
find / -name AdGuardHome.yaml -ls
```

    - '0.0.0.0'
```

ms in advance for my answer, have a great day

**LeVraiRoiDHyrule** OP • 2y ago •

If I do this, it means that the DNS will also be accessible from the outside of my network. Could this be a security problem?

I am hosting some services like home assistant on a Raspberry pi on Port 443 with caddy. Could this cause problem with its access?
