## Flashing A higher power Bios onto a 7900xtx.

Modding

Hi everyone,

I was considering a reference model AMD 7900xtx and water blocking it. Heat dissipation is not a problem so I was wondering if there is a way to up the power limit now that MPT is gone. My idea would be just to take one of the already existing bios's from either the red devil or the nitro plus card and flashing it to the Reference model, but i don't know if this would have any adverse affects that i haven't foreseen. I hear talk of people flashing the 1000w HOF bios onto NVIDIA cards and that's essentially the idea I'm going after.

I am aware that it is generally a bad idea to put that much power through 2 8 pins, but with quality connectors and 16 gauge wire i don't foresee it being an issue.

If anyone has any experience I would love to hear it, thanks in advance.
