„Host access to custom network“ insecure?

[Help](#)

Hey, can someone tell me, if there are any downsides of enabling „host access to custom networks“?

I have nextcloud aio and immich setup with custom networks and every other container on bridge. Accept for adgurd, which is on br0.

I want to install a proxy for all my containers, including immich and nextcloud, which only seems possible if I enable „host access to custom networks“.

Or do I miss something? Thx in advance!

It's not really a security issue, it has more to do with network compatibility with hairpin routing and macvlan networks (though I've never heard of anyone having issues). You can enable it without worries

This has been my main server page for 3 hours, I can't login. How do I restart it safely? This has happened before but I couldn't see a reason in the logs.
