Malesto

I use Straight Talk Home Internet with a router, and I'm curious if anyone has a way to limit bandwidth of specific devices drawing from it, or if its possible to route a secondary router to its internet connection to do that.

UNSOLVED

It's much faster than my old router's speed, however we have many smart TVs in the house and they like to take as much as they can to get the resolution as high as possible and won't allow me to limit it on their end. My old router allowed bandwidth limiting so I locked the TVs to just enough speed to allow for 1080p which was more than enough for what we needed, and allowed us full speed on everything else. This router doesn't have that though, and I'm curious if theres any work arounds to that, or if its possible to connect a secondary router so I can get the speed of this but the control of that one.

You can use your own router. I am using an Asus router with my gateway because the placement of my gateway gives me poor WiFi signal compared to my own router.

That's great! Do you need to put it into bridge mode somehow or does it just work?

I'm interesting in upgrading my 28.8 kilobaud internet connection to a 1.5 megabit fiber-optic line. Will you be able to provide an ip router that's compatible with my token-ring ethernet lan configuration?
