Share subnet with other user

[Help Needed](#)

Dear community,

I have a node that is advertising a subnet. I can access it without any problem, but the user I shared the node with can't. Is there a special configuration I need to set? Or is not possible to do that?

Thanks in advance.

On their site: "Shared machines do not advertise subnets to the tailnets they're shared into, while inviting external users into your tailnet will give them access to subnet routers."

Not possible.

Sharing strips [ACL tags, groups](#), and [subnet](#) information from the recipient tailnet. A shared node is visible only to the individual recipient user—it is not visible to the recipient user's entire tailnet.

Hey, sorry to necro this thread and bother you but [someone shared your reply](#) in a topic I just created. I read the sharing page but was a bit confused because in the "Sharing and Access Control Lists" section it reads:

When a user accepts a share, the user can make outbound requests to the shared machine, which will adhere to any [ACLs](#) defined in the tailnet that owns the shared machine.

Does that mean that we can still enforce ACLs on nodes or shared machines when sharing them individually, or does a user still need to be part of the entire tailnet to see advertised routes?

What about adding the same machine to another TS account? The thing is that previously I used my Wireguard server to access the cameras and devices in my office, but my new ISP is behind CGNAT and I lost access to my VPN. With Tailscale I'm able to see the subnet of the cameras, but I need that in my wife's cell phone. Sorry for the ignorance, I'm just starting to use Tailscale and reading the docs I couldn't understand exactly the use cases of sharing a node.
