How to increase the size of manually assigned vdisk??

So I watched the video but this apparently only works when primary vdisk location is set to "auto", in which case increasing the size is fairly straightforward. How do you increase the size of a manually assigned vdisk??

Near as I can tell if you set a manually assigned vdisk there is no way to increase it's size and the only way to increase capacity is to add a second vdisk...

I had to google that one a few months ago.

(In the VM tab) You have to click the VMs name. Now you see the "Disk Devices" underneath it. While the VM is stopped you can click the capacity and change it.

Thanks, I don't know why this is "hidden" in a very not obvious place.

If that doesn't work then from command line

```
qemu-img resize [vdisk path] +10G
```

to add 10GB to the size, or specify the new total size without the plus, for example:

```
qemu-img resize vdisk1.img 120G
```

will set vdisk1.img to 120GB

That doesn't work in this application because I have manually assigned the vdisk rather than letting it default to "auto".

In the "Edit VM" option the size is unavailable, but [u/the_harakiwi](#) answered it:

(In the VM tab) You have to click the VMs name. Now you see the "Disk Devices" underneath it. While the VM is stopped you can click the capacity and change it.
