WG-easy Is it safe?

As the title suggests, I am using wg-easy from GitHub (<https://github.com/wg-easy>) on an Ubuntu Linux server with Docker. It's very easy to use and create peers. I only allow certain WAN IPs to access the firewall to reach my Wireguard server. However, monitoring the firewall shows connections to a range of IP addresses as shown in the image below. I am not sure if this is secure or if the public and private keys are being leaked by being sent backdoor to another server.

Date/Time	Source	Device	Destination	Application Name	Result	Policy ID
Hour ago	100.113.111.234			WireGuard	✓ 236 B / 120 B	WireGuard (21)
3 hours ago	100.113.111.234			WireGuard	✓ 236 B / 120 B	WireGuard (21)
6 hours ago	100.113.111.234			WireGuard	✓ 236 B / 120 B	WireGuard (21)

Do you have some kind of proof of this? (sending the keys)

If I understand it correctly, those IP addresses you were suspecting were incoming connections, and not the destination.

10 [Reply](#) ...

tbnd36 OP • 1y ago

Well in the firewall it shows those as incoming connections, but it is accepted from the firewall, however the wg-easy edit history does not show any connections coming from those public IPs and I do not share those peers with anyone. anyone else because only certain WAN IPs are allowed to access, and that IP is definitely not a WAN IP on my allowed list.

This IP range is given to ISPs for CGNAT.

CGNAT has its own reserved IP range **between 100.64. 0.0 and 100.127. 255.255.**

Great to know. Didn't realize there was a net between my net and the 'net.

yellow-postit • 1y ago

Post the rule 21 config. I'm not convinced that's setup correctly otherwise if you say you're only allowing certain CIDRs only then this is not a WG issue but rather the config on the Fortigate.

Watada • 1y ago

100.64.0.0/10 is shared address space and not globally unique.

https://en.wikipedia.org/wiki/IPv4_shared_address_space

You linked to [the GitHub repo](#), didn't you?

Why not audit it yourself? **Read the code.** If you're so paranoid about deploying an open source app, why not take the time to read the code itself? It's open source, read it.

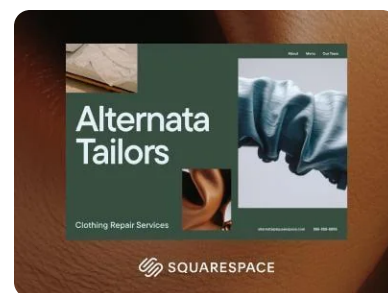

And I did the job you're supposed to do and searched through the source code myself. It doesn't create the IP you mentioned and the only IP it reserves is in the `10.8.0.x` range by default which it reserves for itself and its peers. You would know that if [you actually checked the code yourself](#).

wg-easy is open-source and audited by many.

Of course you can never be entirely sure, but I haven't noticed any incoming connections on my end.
