Wireguard Config Generator (Free web-based tool)

I've just built a [little tool](#) to help with the standard road-warrior setup where you have a server at home and a bunch of clients (laptops, mobiles etc.) that you wish to connect.

Just plug in the parameters for your setup and it will generate all the config files for you.

Would be interested to hear if you find this useful and whether there are any additional features that would be valuable!

Fantastic stuff! Thanks for sharing.

[edit] I have one concern, how can the user be assured the private keys aren't being stored anywhere that could be stolen and used for attacks later on? I would add some sort of security audit, maybe use GitHub and GitHub actions to publish the site.

[edit 2] Juat saw your reply to someone else that everything generated client-side, carry on!

Thanks! I should probably emphasise the client-side aspect in bold letters on the site.

You should add it to <https://github.com/pirate/wireguard-docs#wireguard-setup-tools> !

This is a very slick tool. I just set up wireguard yesterday. I wrote a bash script, but it only does 25% of what this does.

One suggestion- add preshared keys for the clients.

Very cool. Would this set up allow someone to reach their LAN devices at home too?

I'm currently struggling to do that. I've got WireGuard running great on my phone and I can reach home through it but Infuse can't "see" the SMB share I've got at home.

If you choose your CIDR so that the IP addresses of your wireguard clients fall into the same subnet as your home network it should just work. Otherwise you might need to set up some IP routing rules on your wireguard server.

Are those `endpoints` correct in the `peer` parts of the server config? Wouldn't that be the dynamic hostname of the peers in there? Been a while since I set my WireGuard up but I'm struggling to see why each peer would have the server host defined on the server itself.
