Recently zerotier stopped working properly unless I manually set MTU

[Networking & Routing](#)

For the past few weeks, Zerotier locks up when there is a large burst of traffic unless I manually set the MTU of the zt interface to a low value (e.g. 1300) first. This never happened before. Has something changed?

What version of zerotier are you on? The quickest way is from the CLI: `sudo zerotier-cli info` (or no sudo on windows).

I'll forward this to the powers that be. Also, a github ticket or searching our github issues would be immensely helpful: <https://github.com/zerotier/ZeroTierOne>

I see this issue - <https://github.com/zerotier/ZeroTierOne/issues/975> - and a response that the default MTU is supposed to be 1432. But like the last person who responded, I'm seeing 2800 in reality.

Hi, 1432 is a physical mtu. 2800 is the default for the virtual interfaces.

What kind of device is this happening on and what bandwidth? Are they single core VPS instances?

It's a Mac (4-core processor) with gigabit ethernet to a 500mbps WAN link.

MTU of the actual ethernet interface is 1500.

When I run zerotier on a Linux VM under Virtualbox on this same Mac, it has the same problem.

I believe it all started with the upgrade to 1.6.6 though I can't pin it exactly.

I should keep trying, right? I shouldn't just go use Perplexity or Microsoft Azure or anything else, right? Yeah, I'll just keep trying... that makes more sense.

Why is the output not consistent? It's copied and pasted from the right, fed the same amount. Bug?
