how do you use reverse proxy and Proxmox?

New User

as far as I know, reverse proxy managers such as Nginx Reverse Proxy Manager are docker images that run on a machine. say I have 2 VMs for 2 separate self hosted apps I use and want to link to the same domain. do I have to install the proxy manager separately on each VM? or is there a way to have all my reverse proxies under one roof? since I have just one domain.

Basically what you do is that you point your domain/subdomains (i.e. vm1.mydomain.com, vm2.mydomain.com, can setup via A records at your hosting supplier) to your public IP. In uppe router via NAT redirect http/https ports to your NGINX server. In your NGINX server decides what subdomain goes to what internal IP/port.

Hence you run ONE NGINX instance on your network and it redirects to your internal servers accordingly.

2. Wifi LXC controller (Omada or previously Unifi)
3. NPM LXC (add 80/443 rule to firewall)

I set up Dynamic DNS in OPNsense to update my DNS records on my registrar. I then set up my proxy hosts in NPM to do DNS challenges to grab LE Certs. I then point the subdomains to the host on my local network (mostly separate LXCs).

Works great, and is very easy to add/modify services.

My NGINX PM is on a LXC. The only ports that are opened are 80 and 443, and those are pointed to that specific LXC in OPNsense.

<https://tteck.github.io/Proxmox/#nginx-proxy-manager-lxc>

This is what I used to set up my LXC, these scripts on this site are amazing to have.

Why use nginx, why not haproxy?

You don't need to install a proxy manager on each VM. You can set up Nginx Proxy Manager on one machine and point it to each VM using different subdomains or paths. This way, you have a single reverse proxy for all your VMs under one domain.

You just run it on one machine. And then point to the ip of the other services you want to access online.

Proxmox helper scripts has a proxy manager.

Your mileage may vary of course.

No. You can create an internal only network between the two VM's which doesn't have to travel over the wire and the traffic is handled internally to Proxmox. You can then reverse proxy over that network.

MSP2MSP • 8mo ago

Are you doing a different unique network between each VM or the same on all vms?

Forget all those managers, you don't need them at all.
