Github Pages Alternative

What self hosted options are there that provides webhosting and code revisioning similar to github pages?

If it's a static website, it's infinitely easier to just throw it on netlify or cloudflare. comes with the nice stuff like edge and cdns too.

I dunno man, [after that guy was hit by \\$104k bill from Netlify](#) I'd personally stay away. I don't want to deal with something like that, even if it's an error on their part.

If you want more integrations (webhooks to update content on git push etc) have a look at CapRover, Coolify or Dokku. But they are a lot more complicated if all you want is a web server.

RockWolfHD • 1y ago

If you need to keep the content up to date automatically, but don't want to use something too complicated try [git-sync](#)

Take a look at Fossil. A little known, but very good. Maybe an option: <https://fossil-scm.org/>

craftbot OP • 1y ago

"This entire website is just a running instance of Fossil." That's pretty neat. :)

Getlab CE can be run locally. There's also gitea. They're both excellent.

Code hosted on GitHub and then deployed to -

1. Cloudflare Pages
2. Vercel
3. Netlify
4. Render

And the list goes on, I have a bit old (but still relevant blog) on the same: <https://akashrajpurohit.com/blog/top-free-services-to-deploy-full-stack-applications/>

None of these are selfhosted.

I have a tiny Hugo blog I run in its own container off the Hugo web server. Hugo is nice in the way that it will rebuild the site if it detects changes in its source directory, so whenever my gitea ci runs after a merge to main, it just automatically reloads. I doubt this would scale to infinity, but it doesn't need to for my use case. It's a bit more tinkering to set up than GitHub pages and alike, but I feel that's a given with self hosting overall

from Hugo/Jekyll/...). Implement this in a self-hosted way by hosting a Gitea instance with a Gitea runner, whose job it is to run commit-triggered and push your content to a running self-hosted instance of nginx which serves the content to a user.

All of this can be done via Docker containers without polluting the host system with software installations, so you can easily prototype this kinda stuff.

I'm using a [git-sync](#) container to sync the webpage content to a nginx volume. Maybe a bit too DIY, but it works great for me.

Ok-Flounder-9205 • 1y ago

Gitea is my personal favorite! Simple to setup with docker and works as it should.

jersey_illuminati • 1y ago

I run Gitlab for code maintenance and a CI in it to dockerize the code on top of httpd. I use it in this way because I have also backends written in node and frontends written in react that are deployed to same docker environment. I run traefik at the front for proxy
