Setting up Headscale first time on headless Ubuntu server, what UI should I use?

[Need Help](#)

Never tested headscale before, but I could set up a UI for it, (or other alternative to headscale if something better and easier exists (that's F(L)OSS and preferred).

Also, try to get used to the CLI. It provides everything you need (add your devices, and then never need it again), and Web UIs tend to be either incomplete, or broken, or get abandoned over time. While it might be nice to have a website to look at the devices, this is nothing that cannot be done by running "tailscale status" etc. on the command line.

(After a recent update of either headscale or headscale-webui completely broke things for my setup I was happy I still could use the CLI)

I chose the CLI. 😊👍

Fish completion helps a lot.

Do you know any FOSS alternatives to headscale (server)+TailScale (clients)? Self-hosted of course.
