GoodiesHQ

Headscale-Admin (new web UI)

I've been working on a new headscale web UI on and off for the past few months. It has been in alpha release for a few weeks now but will very soon be in beta. Would love to hear feature requests and any bugs you run into.

<https://github.com/GoodiesHQ/headscale-admin>

Thanks!

Thanks for sharing this. I'm running Headscale-Webui: [iFargle/headscale-webui: A simple Headscale web UI for small-scale deployments. \(github.com\)](https://github.com/Fargle/headscale-webui)

How yours are different from it?

Fundamentally, they are very similar, and of course some inspiration (though no code) was taken primarily from headscale-ui. Mine differs I think in a couple minor ways:

- Improved reactivity, things update quickly and feels very snappy.
- Good navigation, easily able to open user info from a node, and navigate to other nodes owned by a user, etc
- A deploy page to aid in the `tailscale up` command when provisioning new nodes.

In the near future, I would also like to have ACL support which is a different beast entirely, but was the original goal for creating my program in the first place.

It is definitely in my plans. The issue is that the API doesn't expose any interaction with it, so I need to write a separate service that exposes its own API to interact with the HuJSON ACL file. It's definitely possible, and I've even thought of possibly using SSR and having headscale-admin interact with the ACL file directly, but decided against it just to keep headscale-admin fully static and portable.

This is a really well considered development, the functionality is simple and elegant. The fact it runs really smoothly and looks very pretty is a bonus!

Great. Headscale-webui is quite slow. I'll try yours

**GoodiesHQ** OP • 1y ago

It's still early in the development stages, so any improvement ideas or bugs are more than welcome!

I have this issue where when i deploy the docker, it seems like nothing works. Does not take api or url. and /web is inaccessible.

a more in depth install or wiki might help

Feature Request:

Local storage path for custom .css files that the container looks for upon loading. That way it gives the end user the ability to create themes of their own and apply them without affecting the themes already created.

This would give the end user the ability to add company or personal logo, change placements of things, create smaller footprint and hide elements they dont wish to see.

This also ensures that if the ui changes in any way, only the custom css file is broken and to alleviate the problem, the user can just rename or remove the css file temporarily and restart the container and all is back to being fixed until the end user fixes their .css file.
