Subnet routing with Headscale?

I am looking how to achieve that but this issue got me very confused:

https://github.com/juanfont/headscale/issues/117

The lead from the project told the guy to use headscale, the control server to enable routes there whereas in the official tailscale people would normally do that from the client.

So how do you enable subnet routing in order to access resources from a LAN once connected via VPN?

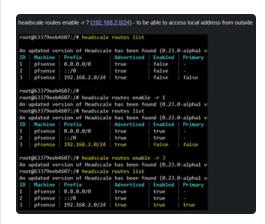

tailscale up --advertise-routes=192.168.2.0/24 --login-server=http://headscale.yourdomain.com:8080

After that, you have to authorize it with a headscale command. To do that, first, to check which route id to authorize:

headscale routes list

You'll see a list of tailscale client(s) which is/are advertising. In the screenshot, it is number 3 which you have to authorize, so issue below command

headscle routes enable - r 3

ie-redditor OP • 8mo ago

all right, I am not using 'tailscale up' like people do, but 'set' instead, what is the difference?

Using up forces me to pass the auth and login server all the time and apparently using set works, I ask because I don't want to start stop the client every time just adjust settings.

And thanks, that worked, the issue I linked was wrong when I checked the --help from the command line I imagined it was obsolete.

Thank you, this helped me.

One question, is there a way to block a client from accessing the LAN network?

I wish I had 18TB/s Internet, for free, on any device, wherever I happen to be, for the rest of my living days, and beyond as my next of kin inherit it.
