Notes about e-mail setup with Authentik

Guide

I was watching [this video](#) that explains how to setup password recovery with Authentik, but the video creator didn't explain the email setup in this video (or any others).

I ended up commenting with him back and forth and got a bit more information in the comment section. That lead to a rabbit hole of trying to figure this out (and document it) for using gMail to send emails for Authentik password recovery.

The TL;DR is:

- From the [authentik documentation](#), copy and paste the block in this section to the .env file, which should be in the same directory as the compose file
- Follow the [steps here from Google](#) on creating an app password. This will be in the .env file as your email credential rather than a password.

Thanks, found I had to apply in docker to both the server and worker containers.

Thank you for this clear explanation. It is very helpful and I could implement it correctly in one shot. I used the above information to update my .env file and recreated the containers. There is a small typo above, the SSL port is 465. I used the SSL settings. Once the authentik containers were up, I gave the following command from my terminal to test the setup and received an email from authentik successfully.

```
docker compose exec worker ak test_email <my email>
```

Thank you once again.

Very handy! I tested with normal docker with success:

```
docker exec <name of the worker container> ak test_email <my email>
```

For the gmail app password, are you including spaces? or is it just 16 character string

EDIT: no spaces

You sir are a gentleman and a scholar, thank you for taking the time to make that excel and sharing your work

Thank you :) Regarding the app password, it's exactly as it's provided by Google. I don't recall how many characters it is but I don't recall it having any spaces.

Il faut d'abord activer un 2FA si ce n'est pas déjà le cas pour pouvoir configurer un mot de passe d'application (et que le lien fonctionne)
