"Connection Refused" Error when connecting to Proxmox web GUI

Question

Hello all! I am very new to proxmox and networking in general. I was into it months ago, but stopped due to school and extra curricular activities taking up my time. I've recently gotten back into it, but I've forgotten almost everything I knew before. I went from a TrueNAS Core server for cloud storage to Proxmox because I switched my motherboard (which caused issues I didn't know how to fix) and because I wanted to create VM's.

Starting the install of Proxmox VE 8.1, I went through and selected all the correct info, but the main part I have an issue at is IP addresses. I used my subdomain that I made on FreeDNS, and used what I thought to be an open IP on my network for the address for the server. (I am not sure how to check this, as I said my knowledge is limited). For DNS server, I used the default 127.0.0.1. After installing, I was able to use the terminal, but when I tried to access the server using the IP, I got a "connection refused" error on Chrome and Edge. I tried looking at a couple threads with solutions on the Proxmox Forum, but I'm not sure if I understood them completely.

If anyone has anything I can try, it would be greatly appreciated. Networking is extremely exciting and interesting

Add the port to the url you are using : <https://192.168.0.10:8006>

And for

and used what I thought to be an open IP on my network for the address for the server. (I am not sure how to check this, as I said my knowledge is limited).

Use Ping. If it pings, the address is in use.

EQU_Sailor OP • 1y ago

If you are asking if I did (example IP) "<https://192.168.1.34:8006/>" then yes, I did. Is there anything I need to change with that?

And when I ping the address, should the server be off to test if it's already in use, or could I just ping it when the server is on? If the latter, than I have already tried that and it pinged back.

Thank you btw
