How I fixed Windows not recognizing SSD in Disk Management, but BIOS does

Solved!

When installing a new SSD a few years ago, my BIOS recognized the empty SSD but Windows didn't (doesn't even show up as unformatted, it just isn't in Disk Management at all), and all tutorials I found didnt work. The solution I found was use the BIOS to boot to the empty SSD, fail, then go back to Windows which will now recognize the SSD as unformatted. Then format the SSD and it will work. Hoping some random person in 8 years will stumble upon this while Googling and solve their problem.

EDIT: Operating system was Windows 8.1, ssd was 2TB WD SATA SSD

Worried about costs? Switching from MagicINFO to Samsung VXT was smooth and secure — and it cut expenses while keeping things efficient.

Tried so many things, with multiple hard drives... after a while just came to accept my brand new custom built was going to live on the 500GB boot drive. It this works I am going to have to name my first born child after you. Hope my wife is going to take it well lol.

Not sure what tutorials you found. Usually when I run into stuff like this, the diskpart tool usually fixes it

Diskpart!

Select Disk X

Create partition primary

Format to your needs!

I had same issue but the problem was Windows converting SSD from GPT to MBR.. took a looong time to figure out but running now!!

With older versions of Windows MBR has to be used but newer Windows converts to GPT automatically.

For anyone who doesn't know: MBR is the old style of drive partitioning. GPT is the new style. But windows *does not tell you* whether or not you're looking at an MBR or a GPT drive. You have to use some more advanced tools to figure that out (eg. Diskpart).

Frankly I think the fact that windows doesn't tell you any of this stuff when you're installing is really dumb. Its a big enough issue that it causes some hard drives to not even fucking work for some people, FFS. It should give you an immediate warning that you're running MBR instead of GPT when you try to install, or if it's having any problems detecting your drive. Its totally unacceptable.

Learn how to use the command line tool Diskpart

Launch CMD

Diskpart

List Disk

Select Disk X

Clean (this will remove all partitions, delete all data, etc)

After that you can continue to use diskpart to make a new primary partition, or use windows disk management from here on.

I've had to do this many times with USB keys and external HDDs that weren't recognized.

So you found the solution to a problem. What's left is to know the cause.

SSD not showing up, froze it, didn't help. Noticed these parts defrosting first. What could this mean? What can I do to retrieve data? Is it all gone?
