Intel® HD Graphics 530 for 4K hardware transcode

Question

Hi all, I recently walk into self hosted things ;) and now I dealing with video transcode. I'm running proxmox with I5-4430U(Intel HD Graphic 4000). I have LXC container with docker and iGPU passed to it. Every thing work well till I try to run 4K HEVEC video. It's laggy and it's doesn't matter if I watch it transcoded to 1080p or 4K. Is changing my processor to i7-6700t(intel hd graphic 530) with better igpu solve this? Does anybody had this issue?

i7-6700T iGPU cannot handle HEVC 10bit video. You need 7th gen or newer.

[Intel Quick Sync Video](#)

Intel Quick Sync Video is Intel's brand for its dedicated video encoding and decoding hardware core. Quick Sync was introduced with the Sandy Bridge CPU microarchitecture on 9 January 2011 and has been found on the die of Intel CPUs ever since. The name "Quick Sync" refers to the use case of quickly transcoding ("converting") a video from, for example, a DVD or Blu-ray Disc to a format appropriate to, for example, a smartphone. This becomes critically important in the professional video workplace, in which source material may have been shot in any number of video formats, all of which must be brought into a common format (commonly H.264) for inter-cutting.

Intel HD Graphics 530, random (every 10 seconds or minutes) black screening/monitor loses connection for a few seconds before fixing itself, very annoying
