Full Disk Encryption Install question

I'm attempting to reinstall my Debian 12 with FDE, since, I didn't realize that you couldn't do this at a later time.

Most of the tutorials I'm watching say to click "manual".

And then, they all say something a little different. And most of them are using VM's to do the install.

So, I just got a little worried I would click the wrong thing, or fuck something up.

There's only 2 drives on my laptop.

1 labeled "something SD card something"

And

The debian installer makes luks/btrfs hard when it's easy on other distributions. There is
https://spirallinux.github.io/ that makes it easy though... it has some presets you can disable

I tried to make that easy and accessible to everyone, as per the Debian Social Contract.

Or you can select "use the whole disk and set up encrypted LVM", **BUT** only if you truly want to use the full disk. So that's a no go for dual booting. Also, /boot will be encrypted this way, so that's a plus or minus, depending on what you want.

Let me ask you this, I don't think im interested in dual booting (dual booting is where you have 2 OS's on one hard drive, right?)

Would booting from a usb drive be considered dual booting? Even though I only have one actual OS installed on the hard drive?

Would it still be possible to boot from a usb drive if I do choose to encrypt the boot drive and everything?

/boot… not "boot drive"

are there any reasons to NOT use btrfs (instead of ext4)?

30 upvotes · 75 comments

r/osdev • 2 mo. ago

I did it. I loaded a file from disk and executed it for the first time using my filesystem driver and system calls!
