Nightly Drop Of Mapped Network Drive

Every morning when i log into my new proxmox server a mapped drive from proxmox to unraid for backups has a question mark on it and gives the following error

unable to activate storage 'backups' - directory '/mnt/pve/backups' does not exist or is unreachable (500)

findmnt shows

```
└─/mnt/pve/backups //10.0.3.20/backups
```

cifs

```
rw,relatime,vers=3.1.1,cache=strict,username=csmashe,uid=0,noforceuid,gid=0,noforcegid,addr=10.0.3.20,file_mode
```

A reboot of the system fixes the issue but i can not find any other way to get it to recognize the drive anymore

If anyone else finds this because they are having the same issue it has been resolved.

The issue is when the mover moves the files from the cache drive in Unraid to the storage drive some information that linux uses is now stale and it breaks the share.

Fix is set your network share that you are using for proxmox to cache = no so you bypass the cache drive.

if i traverse to /mnt/pve/backups in the shell it works but if i ls i get

ls: cannot open directory '.': Stale file handle

I turned on NFS and redid the mount using that (was using SMB) and it is now connected. I will see if it keeps the connection over night and report back tomorrow if not.

Same issue is happening with NFS.

There is an error now in dmesg

```
[133319.065010] NFS: server 10.0.3.20 error: fileid changed fsid 0:159: expected fileid 0x3300000022801a, got 0x9010001800000080
```

Any other ideas?

I have spun up a vm and connected to the mount point. I will see if its still connected tomorrow. Yes would mean its a proxmox issue, no would mean its an unraid issue.

Will add more info tomorrow

starts every hour or so.

But you do have an underlying problem, machines don't "just disconnect randomly"

TBH I think there's a bunch of issues with the last couple of revisions of Proxmox with tons of problems, I just recently switched back to ESXI because of all of the problems I was having (literally killing my network problems)

the last couple of revisions of Proxmox with tons of problems, I just recently switched back to ESXI

mount -a did not bring it back.

I have not rebooted today so that i can run tests people send

Why does this regularly happen? I only have 24GB RAM assigned. Server gets slow at this point.
