Wireguard for headless Linux machine?

My internet speed is 380/50 and I have been running PIA on a headless Ubuntu machine for torrents for the best part of year now with OpenVPN. With the VPN enabled I get around 100Mb down and 50Mp up which is...fine. Well today I changed another PIA client to use Wireguard instead and I get pretty much my normal speeds (380/50). I can't find any Wireguard configs for PIA though, they only seem to offer Wireguard through the GUI app which is a bit of a pain because, as I said, my server is headless. Do they have Wireguard configs and I just can't find them? Are they going to be releasing them?

Here's [PIA's official bash scripts](#) and [my own PIA-wireguard scripts](#) and [u/threarah's PIA-wireguard docker container](#) - take your pick :)

There are no wireguard configs generally available because wireguard doesn't work like that - you need to https-post to your selected endpoint to trade public keys and other metadata before establishing a wireguard link.
