Sonarr in Docker has much worse performance and responsiveness than when installed on bare metal

[discussion](#)

Everything works, but is much less responsive. Scrolling through my list of shows is very chunky and constantly hitches as it loads in the new artwork as I scroll. Searches take forever both searching indexers and just the "Add New" search. Scanning/importing is also super slow. I should say this is the same for Radarr as well

Before I switch back to just installing it natively on my server is there anything I can try to improve responsiveness in docker?

Specs:

i5-4570

8GB 1600mhz DDR3

Quadro p400

No issues here. Is the persistent data volume on an NFS mount by any chance?

[Skip to main content](#)[Log In](#)

Nope :(ya it seems like it works well for pretty much everyone which is what made me start thinking I must be doing something wrong here or there's some setting i missed or something. hardware's getting a bit old but for this kind of thing I figured it should be plenty

Using compose? Do you got any logs?

I have a full *arr stack in docker running off of an SD Card in a Raspberry Pi 8gb 4+ feeding downloaded data to a Synology NAS from which a Plex Media Server gets data on an NVIDIA Shield Pro.

The Sonarr GUI is incredibly responsive, no complaints at all. The only thing that I noticed is when Sonarr is searching indexers for a release it bogs down IO speeds and the network, but it's only temporary.

SSD mounted as root (/) was nearly full.

SSDs become much slower when they are nearly full.

Should this be the case, try running "docker system prune" (but make sure that all the docker-images you want to keep are running).

This will get rid of all the unused stuff docker is saving. (Old docker-images, old volumes, etc.)

First time I ran this it freed up over 30 GB (which was a lot considering my / only has a 70 GB partition since I separated / from /downloads which is also on the SSD).

Something else that can make docker slow to respond is if it does a lot of searching in parallel. So if you bulk-add some 300ish shows (like me after setting it up) and set them to search for upgrades (like they are in 720p and sonarr looks for 1080p) automatically.

I had this problem after a defective SSD a few years back when I had to reindex everything.

Otherwise try running top on your server and check if there is some process clogging your CPU and or Memory.

Otherwise: I am running basically the same setup as you (Ubuntu 20.04 LTS, same amount of RAM and my i5 is even a generation older than yours) and it rarely makes any problems.

And that after a few OS-Upgrades (installed as 16.04 LTS originally)

Although my SSD is getting more and more difficult to keep enough free space - already dreading a reinstall, although it should go fairly smooth since I keep all my docker-volumes in one place and have next to nothing directly running on the machine :)
