Anyone have an EASY guide to follow to setup NGINX Proxy manager?

[Help](#)

I've been using cloudflare zero trust because it's freggin easy. But I want to setup nextcloud now and the data limits will be an issue. Right now I use tailscale to connect to my unraid server then I have the zero trust with dns links to each of my services; sonarr.myserver.net, radarr.myserver.net, etc.

I'm trying to setup nginx proxy manager with cloudflare so that I can have nextcloud up and running. I don't know networking on this level. I follow guides. So when someone says "Why don't you just XXXX" the answer is because I don't know any of this. I keep trying to follow vids but spaceinvader went with swag. I thought I'd be as easy as setting up nginx like all my other dockers and just listing the IP and port in the zero tunnel to bring up nginx but it doesn't want to play ball. Anyone with an easy guide? I'm not trying to do everything all at once which most the guides seem to do. It's always "How to setup a reverse proxy with next cloud and cloudflare". Lets try one step at a time because I'm getting nowhere.

EDIT

For more security you can also use Authelia with NGINX

I honestly have started to not like their videos. They always reference other videos within the one you're looking at so now you have to go watch something else and they always talk about their documentation which is the most convoluted and pain to use I've ever seen. It's like there's three things to copy past. Why mention your documentation, without any links to the documentation so you have to go searching around and digging through it, when you could have just posted it there and kept it simple. Or they try and teach you about everything. What it is, why it exist, what it can do for you, etc. It's like asking how to use a light switch and getting 10 min of talk about what electricity is when all you really want to hear is "Go over and flip it up". They also never address potential fail points so if your setup isn't exactly like theres and you get an error you're just left hanging. Like he does everything with a custom docker network. Not a big deal but if you're completely new now you're wondering WTF is that, what does it do, do I need it, how do I get one, can I even follow this guide since I don't have one. They never start basic and just keep it basic.

Are you behind isp cgNAT? If not then you just need to open port 80 and 443 in your router.

Also change your unraid ports to something else like 880 and 8443.

Add A record *.example.com on Cloudflare.

Install npm container on unraid and set it up.

If you're behind cgnat then you need a vps. You may use Oracle free tier for this.

If you're using cf tunnel then you can get your system url and point it to that as CNAME. in this case you won't need to open ports but I am not sure.

Those are the tasks without the how, and the core question is addressed in a bullet to "install and set it up" when someone is asking how to set it up

Network chuck has a good video, not unraid specific but I was able to follow it

I setup nginx on my Opnsense router last week with Let's Encrypt certificates for TLS. This week I added my services as Dockers in Unraid. So far I got Plex working, as well as Nextcloud, Grocy, and Home Assistant.

Setting up nginx with certificates, locations, upstream servers, rules, firewall was not trivial. Getting Nextcloud to work with it needed another chunk of manual configuration

I prefer running nginx on the router to make use of firewall rules and have the outside Internet terminate on a different machine than my personal data. But that's just personal preference

I might try and write up the steps I took although I'm not fully sure how I actually got it running in the end 🙄

Hey OP. Just setup nextcloud via Nginx this past week. Another person linked the Ibracorp video on NPM which is what I personally used to setup Overseer. I mimicked the settings I used for overseer and had great luck.

[Here are my settings for the nextcloud subdomain.](#) Feel free to reply with any questions or DM (not chat).
