[dumb question] gaming pc in a server rack. playable from anywhere in the house?

[Discussion](#)

TLDR:

can i make a centralized gaming computer accessible from anywhere in my house?

so i have a thought but dont know if its possible and def not sure if its possible to do within a budget thats not unreasonable. but figured this would be a good place to ask the question.

my house is wired for ethernet(only cat5e no fiber or anything. but i plan to change that eventually over time)

my thought is i have guests occasionally that game such as a few buddies that visit from another state and like to game with me. as well as my sister and mother live in my house and sisters boyfriend games. i was wanting to setup a server for the house. ex navy and used to take movies and tv shows with me since not always able to access streaming services and such. and wanted to put those all onto a server that allows me to stream to

Sunshine (server) and moonlight (client) do great for this. You may need a dummy plug to trick windows into thinking you have a monitor attached.

I use this in our place to play games when I'm away from my desktop. Not sure about latency for FPS games but it great for more strategy stuff that I'm into.

Have shared gaming PC set up like this for tv room and kids to use. Sunshine and Moonlight app for laptops/android tv, phone, what ever needed. Even Oculus over Air Link works with it.

With Steam Family sharing now I can have a family shared steam account set up on the PC and still play other games on my main machine when the kids want to play something.

you can get some kind of hdmi-over-fiber adaptor IIRC.

I play cities skylines 2 over remote desktop and Im perfectly happy with it but last time I said that on here I got the impression that people think im stupid

its funny i accidentally bought a 8 display repeater(thought it was the opposite) a long while back. and if i did this with that then it would be able to repeat the display to more then every room in my house lol. so this might actually make that item i never returned useful.

Craft computing on YouTube has done some remote gaming servers that may fit your use case. Fibre HDMI and USB over Ethernet are probably the most reliable

My (technically) first watercooling system. Started by going big with whole server rack watercooling. Still in the first revision phase and due to upgrade ASAP.
