Fit-Day-2402

VNC latency for PiKVM

I am considering using PiKVM for my home lab setup.

I have saw that PiKVM supports VNC connections, which may be necessary for my purposes.

(<https://docs.pikvm.org/vnc/>)

I would like to know about the latency.

They mentioned that there would be performance issues compared to regular VNC software, but I could not find any references to how significant these issues would be.

Will there be notable performance issues when using it?

Hello. This will be a bit slower than regular VNC, but faster than browser access. The reason is that the physical image capture, encoding and transmission over the network cannot work at the same speed as the VNC server installed on the operating system directly. At the moment, the best result with VNC is 50-70ms, and don't believe anyone who says it can be done much faster.

Same here, VNC over a wired connection is about as fast as it gets. A good trick to make it feel subjectively faster for general use is to turn on local cursor display.
